

Medical & Safety Review (MSR)

Transform Clinical Data Review

CluePoints Medical & Safety Review (MSR) turns mandatory ICH-GCP Medical & Safety Review from a static, manual exercise into a live, operational workflow. Through scheduled, validated access to consolidated clinical data and delta views that focus reviewers on meaningful change, MSR helps medical monitors and safety reviewers detect issues earlier and demonstrate audit-ready compliance with confidence, without waiting on data mapping or programming cycles.

Built for Clinical Data Managers, Medical Monitors, and Safety Reviewers, MSR replaces manual navigation, offline tracking, and programming dependency with a purpose-built, validated review workflow that is accurate, auditable, and deployable in days, not months.

CHALLENGE	CAPABILITY
Stale or Delayed Data Access	Access consolidated clinical data through scheduled, validated EDC pulls with daily refresh, so reviewers work from current data.
Lengthy Visualization Preparation	Streamline study preparation with a comprehensive standard visualization library and the ability to copy and reuse dashboards across different studies.
Repeated Full-Data Scans	Delta views isolate what changed between refreshes, so reviewers focus on meaningful change rather than re-reviewing everything.
Slow Outlier Identification	Identify common outliers rapidly using predefined filters for quick and accurate record identification.
Inefficient Data Query Process	Enhance query management with clear status updates, comprehensive EDC feedback, and streamlined downstream assignment.
Tracking Variable-Level Changes	Track variable-level delta changes with automated calculations from the previous review for easy analysis.
Frequent System Switching	Seamlessly integrate data review and query generation with automatic communication of queries to the source system via API.
Review Variability & Error	Ensure consistent medical review experiences by standardizing processes, regardless of the reviewer or study.

Monitor & Track Study Updates

MEDICAL & SAFETY REVIEW (MSR)

Accelerate Accurate

CluePoints Medical & Safety Review (MSR) facilitates the periodic review of study data through scheduled data refreshes, delta-based change tracking, and consolidated data access. Unlike traditional, manual approaches, MSR allows Clinical Data Managers and Medical and Safety Reviewers to identify outlying values and track changes more accurately.

This not only enhances review efficiency and communication but also elevates patient safety, setting MSR apart as a smarter, more reliable solution for clinical trials.
